protein sequence search 09/993,292

In re: 09/993,292

Please search SEQ ID NO:24.
Please search in commercial and interference databases.
Please print out top 50 hits.

Thanks.

Patricia A. Duffy, Ph.D. Art Unit 1645, Remsen 3B05 571-272-0855

Patent No. 6583275
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Lynn A Doucette-Stamm and David Bush
APPLICANT: Lynn A Doucette-Stamm and David Bush
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO
TITLE OF INVENTION: ENTEROCOCCUS FAECIUM FOR DIAGNOSTICS AND THERAPEUTICS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                18;

Sequence 18018, Application US/09248796A
Patent No. 6747137
GENERAL INFORMATION:
GENERAL INFORMATION:
TILLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO CANDIDA ALBICANE
TILLE OF INVENTION: POR DIAGNOSTICS AND THERAPEUTICS
FILLE REPERBNICS: 107196-132
CURRENT APPLICATION NUMBER: US/09/248,796A
CURRENT FILLING DATE: 1999-02-12
PRIOR APPLICATION NUMBER: US 60/074,725
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           641 DLDRLKEEIEKSSKQRAMLAGATA--VYSQFITQLTDENQSCCPVCQRVFQTEAELQEVI 698

Sequence 4, Application US/08434000A

Patent No. 6046037

GENERAL INFORMATION:
APPLICANT: K.-C. MA, THOMAS LEHNER
TITLE OF INVENTION: IMMUNOGLOBULINS CONTAINING PROTECTION
TITLE OF INVENTION: PROTEINS IN PLANTS AND THEIR USES
NUMBER OF SEQUENCES: 19
CORRESPONDENCE ADDRESS:
ADDRESSE: Lyon & Lyon
STREET: 633 West Fifth Street
STREET: 633 West Fifth Street
STREET: Calite 4700
CITY: Los Angeles
STATE: California
COUNTRY: U.S.A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CLASSIFICATION: 435

```
The present invention relates to a system for expressing a protein of interest. The system comprises an expression vector having an expression cassette comprises an expression cassette. Where the expression cassette comprises an export protein coding sequence genetically fused to a DNA sequence encoding the protein of interest, a host cell transformed host cell, where the expression vector, and a culturing environment for the transformed host cell, where the expression cassette expressing at expression vector protein of interest fusion protein which is exported out of the host cell. The system is useful for expressing agene in a bacterial cell, by providing an expression vector to a population of untransformed bacterial cells, and expressing the expression cassette such that the export protein of interest fusion protein is produced and exported into the culture medium. The protein of interest is preferably an antigen and this method is useful for the system is useful for the production of recombinant protein. The system is useful for the production of recombinant proteins inside a bacterial host cell, in a bioreactor, and various devices that facilitate the growth of bacteria. The system is also useful for preparing inmunogenic composition capable of facilitating the generation of an immune response in an animal manner and animal shows the for vaccinating animals, and even in the food animal for preparing animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         biomediation, waste disposal, and waste treatment industries. ö
is very advantageous for protein expression, as proteins that are toxic to host bacterium can also be expressed. A population of recombinant host cells can be transformed with the expression vector, and then the population of bacterial host cells can be maintained in culture and used to produce proteins without having to harvest and lyse the host cells. The present represents Salmonella typhi ClyA protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LKLATEIAAIGEIKTETETTRFYVDYDDLMLSLLKGAAKKMINTCNEYQQRHGKKTLFEV 300

The present invention relates to a system for expressing a protein of interest. The system comprises an expression vector having an expression cassette, where the expression cassette comprises an export protein cassette where the expression cassette comprises an export protein coding sequence generically fused to a DNA sequence encoding the protein coding sequence generically fused to a DNA sequence encoding the protein coding sequence generically fused to a box cell. The system is useful, for expression of the host cell. The system is useful for expression of untransformed batterial cells, more expression vector cassette express the exported out of the host cell. The system is useful for the capression of untransformed batterial cells, and expression vector capped in a pacterial cell, by providing an expression vector of a population of untransformed batterial cells, and expression vector capported in special protein of interest spression cassette, such that the export protein of interest cusion protein. The export protein may be a member of the HIVE family such as cytolysin A cortain of interest is preferably an antigen and this method is useful for the production of recombinant proteins. The system is useful for the production of recombinant proteins can almade and an animal antigenic material against which an immune response may be mounted. The obtained recombinant bacterium (e.g. Salmonalla) con providing an animal antigenic material against which an immune response the generation of an immune response in an animal. The system is also useful for preparing immunogenic compositions for vaccinating animals, the generation of an immune response in an animal. The system is also be useful for preparing immunogenic compositions of recombinant host cells can be adapted by an expression, as proteins that are toxic to host bacterial may be expressed A population of pacterial host cells can be expressed. A population of produce proteins without having to harvest and lyor the host cells cells can be expressed. A popul
                                                                                 Novel system for expressing protein of interest, has expression vector with cassette having export protein coding sequence fused to protein coding sequence, host cell transformed with vector, and culturing
                                                                                                                                                                                                                      Example 3; Page 25-28; 33pp; English.

The invention relates to the isolation of genes and their encoded proteins from Photorhabdus luminescens. The isolated sequences are proteins from Photorhabdus luminescens. The isolated sequences are proteins for detecting the genome of P. luminescens and are attacked species; to study polymorphisms; for gene analysis and for detection/amplification of the genes. Antibodies (Ab) raised against the polypeptides encoded by the genes are used for detection/dentification of P. luminescens, e.g. in foods. The genes, proteins, Ab and cells that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that carry a gene-containing vector are used to select compounds that corresponds or mincrogramisms other than P. luminescens and are able to alter response or sensitivity to toxins and antibiotics produced by P. creombinant production of the proteins, particularly toxins and antibiotics proteins are useful for treombinant production of the proteins, particularly toxins and antibacterials useful as insecticides, bactericides and fungicides. The therapeutically (to treat microbial infection by bacteria or fungi that are sensitive to P. luminescens encoded toxins or antibiotics) and as are sensitive to P. luminescens encoded toxins or antibiotics) and as are sensitive to P. luminescens and the proteins are as virulence factors and for identifying targets of human diseases for which P. cequence represents one of the isolated P. luminescens proteins
                                                                                                                                                                                                                                                                                                                       Antibacterial; fungicide; insecticide; polymorphism; genetic analysis; detection; food; gene expression; plant; animal; microorganism; toxin; antibiotic; biopesticide; virulence factor; disease model; plague;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Duchaud E, Te
Buchrieser C;
                                                                                                                                                                                                   20-NOV-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28-NOV-2002.
                                                                                                                                    ABM68103;
                                         ABM68103
RESULT
                                                                                                 The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cativity of (II) is useful in gene therapy techniques to restore normal activity of (II) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating of supplement. (II) and its binding partners are useful in medical imaging of supplement protein expression or biological activity. The involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in addisorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Absolution-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   70 MDSQDKYFEATQTVYEWCGVVTQLLSAYILLFDEYNEKKASAQKDILIRILDDGVNKLNE 129
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
      Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

The invention fracters to an instruction where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense ancience are in similar and in the state of the nucleic acid operation of its fragment whose expression is inhibited by the antisense antisense confirmation of the polypeptide of specifically binding the polypeptide of its fragment whose expression is inhibited by the antisense ancience acid; (3) a nost cell containing the vector; (3) an isolated of the polypeptide of its fragment whose expression is inhibited by the antisense ancience acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular composition or the activity of a gene in an operon required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound; eactivity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent of the strains is present in a culture or collection of an organism. The antisense nucleic acids are useful for genetifying proteins or screening for homologous nucleic acids required for proliferation to isolate candidate molecules for rational culture dear or obliferation of an organism, or for screening homologous nucleic acids required for proliferation in the process of the strains in the proliferation of an organism. The antisense nucleic acids required for proliferation is screening for homologous nucleic acids required for proliferation is an event of the screening for homologous nucleic acids required for proliferation is a present earning the present earning to a process or obliferation is a present earning the present earning the present earning the present earning the present earning the

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              163 TSRALKDYGYTQQEILKFTEAANNAMTIGGVGAQQQAAALMQLSQALGSGVLQGDEF--K

Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9 TVEVVKSAIETADGALDFYNKYLDQVIPWKT-----FDETIKELSRFKQEYSQEASVLVG

The invention relates to new Proteus mirabilis polypeptides and polymucleotides. The invention also relates to antibodies against the polymetides, amethod of generating the polypeptides, amethod of generating vaccines for immunising an individual against P. mirabilis, a method for evaluating a compound for the ability to bind a P. mirabilis activity. The polypeptides and polymucleotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of bacterial diseases, as components of antibacterial vaccines, as targets for antibacterial diseases, as components of antibacterial vaccines, as targets sequence represents a Proteus mirabilis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                      New Proteus mirabilis polypeptides and polynucleotides, useful as reagents for diagnosis of bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or as biocontrol agents for plants.

producing Myperimmune serum-reactive antigens from a pathogen, tumour, allergen, a tissue or host prone to auto-immunity, where the antigens are allergen, a tissue or host prone to auto-immunity, where the antigens are used in a vaccine, comprises providing antibody preparation from a plasma pool of a type of animal, or individual sera with antibodies against the specific pathogen, tumour, allergen, tissue or host prone to auto-immunity. The hyperimmune serum-reactive antigens comprising any of the car immunity. The hyperimmune serum-reactive antigens comprising any of the car their hyperimmune fragments are useful for the manufacture of a pharmaceutical preparation, particularly a vaccine against taphylococcal infections or colonisation against S. aureus or S. epidermidis. The preparation of antibodies is useful for the manufacture of a medicament or against S. aureus or S. epidermidis. The actions or colonisation against S. aureus or colonisation against S. aureus or colonisation can amine a methody preparations may also be used for diagnostic and imaging purposes. Other conditions that can be treated include cancer, autoimmune diseases or infections caused by viral (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This sequence represents a staphylococal protein relating to the method for identifying and producing pathogen specific antigens of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    49

                                                                                                                                                                                                                     the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8)
                                                                                                                                                               162 TA-----SRSPYLSVHAS-LRK------VIEOIIADGKVDESEK 1193
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

pathway in which a proliferation-required gene or its gene product lies or agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed of (12) determining the extent to which ach of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the strains; or (13) identifying the target of a compound that inhibits the strains; or organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational for did discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, C. The target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained to the electronic formed directly from NIPO at

E. faecium protein sequence SEQ ID 3944.

```
Entercoccus faccium encoding an Entercoccus faccium polypeptide having one of 10 fully defined sequences given in the (or comprising 40 sequences the form and the comprising 40 sequences hybridising to it). Also included are a recombinant vector comprising the nucleic acids, its complement or sequences hybridising to it). Also included are a recombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a chosen from 3654 disclosed sequences encoding 3654 disclosed proteins. The nucleic acids is useful for diagnosing pathological conditions resulting from E. faecium bacterial infection (e.g. urinary tract infection) and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida albicans mucleic acid is useful for recombinant production of Candida albicans and vaccines containing the nucleic acid are useful for preventing or treating Entercoccus faecium infections. The present sequence represents
                                                                                                                                                                                  New isolated nucleic acid derived from Enterococcus faecium encoding a
Enterococcus faecium polypeptide useful for detection, prevention and
treatment of a pathological condition resulting from a bacterial

The invention relates to an isolated nucleic acid derived from Enterococcus faecium encoding an Enterococcus faecium polypeptide having one of 10 fully defined sequences given in the (or comprising 40 complement or sequences hybridising to it). Also included are a recomplement or sequences hybridising to it). Also included are a recomplement vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid. The nucleic acids are chosen from 3654 disclosed sequences encoding 3654 disclosed proteins. The nucleic acids is useful for diagnosing pathological conditions resulting from E. faacium bacterial infection (e.g. urinary tract infection) and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida albicans derived peptides or antisense polypeptides. Pharmaceutical compositions and vaccines containing the nucleic acid are useful for preventing or and vaccines containing the nucleic acid are useful for preventing or and vaccines containing the nucleic acid are useful for preventing or and acid as useful for acid are useful for preventing or and acid as a page and a preventing or and acid are useful for preventing or and acid as useful for preventing or and acid are useful for preventing or and acid as acid are useful for preventing or and acid are useful for preventing or and acid as acid are useful for preventing or acid as acid as acid are useful for preventing or acid and acid as acid are acid as acid are useful for preventing or acid and acid as acid as acid as acid as acid are useful for preventing or acid and acid as acid as acid as acid as acid are useful for preventing or acid and acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid as acid 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      226 SVTVKQANKDIDAAKLKLATEIAAIGEIKTETETTRFYVDYDDLMLSLLKGAAKK---- 280

proliferation or that has an excivity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underspressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids cequired for proliferation in cells other than S. aureus, S. typhimurium,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid, (2) a host cell containing the vector, (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of

K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of
the target prokaryotic essential genes. Note: The sequence data for this
patent did not form part of the printed specification, but was obtained
in electronic format directly from WIPO at

The invention relates to an isolated mucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) and best cell containing the vector; (3) an isolated polypeptide; (5) producing the polypeptide; (5) producing the polypeptide; (6) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway the gene product or that has an activity against a biological pathway in which a proliferation-required gene product lies cequired for proliferation or the biological pathway in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiocic; (10) profiling a compound; a activity; (11) a culture comprising strains in which the gene compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiocic; (10) profiling a compound; a activity; (11) a culture comprising strains in which the gene conduct is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational
isolate candidate molecules for rational drug discovery programs

ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               568 EQVNKDIIPSNYTLASYNKY------NKLKERAQTVLDEETNNTPFNQRYSQTQI 616

Also included are a recombinant vector comprising the nucleic acids its complement or sequences hybridising to it). Also included are a recombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid. The nucleic acids are chosen from 364 disclosed sequences encoding 3654 disclosed proteins. The nucleic acids is useful for diagnosing pathological conditions cresulting from E. facetium bacterial infection (e.g. urinary tract infection) and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida albicans derived peptides or antisense polypeptides. Pharmaceutical compositions and vaccines containing the nucleic acid are useful for preventing or treating Enterococcus faccium infections. The present sequence represents

injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

```
The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a ckit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a compound to an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more computed to the compound that modulates its activity is useful for preparing a medicament for treating colypeptides or their antibodies. The polynucleotide or the compound injury (CCI) and spared nerve injury (SMI) in an animal (e.g. spin et therapy). The sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form part of the printed specification) which is differentially expressed during pain. Sore:

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1910 QLVKEKTKVESEIRKE-YMEKIQGAQKGPGSKIHAKELQ-----ELLKEKQQEVKQLQK 1962
